Notes to Economic Data Table

GNP Gross National Product is the economist's measure of the total output of goods and services of a country. To enable international comparison, it is expressed in US dollars using a three-year weighted average of local prices and exchange rates. Per capita GNP figures are a conventional basis for comparing standards of income and living between countries and for assessing progress within each country from year to year.

GDP Gross Domestic Product differs from GNP mainly in excluding income from abroad. The GDP distribution figures, being percentages, should add up to 100%. However, the variables used in computing GDP often differ: for example, some industry figures may or not include a manufacturing element. Again, some variables may be counted in either services or industry. In view of the differences inherent in GDP computation, the distribution figures may not always add up to 100.

Balance of payments includes total trade balance, total services debit and private transfers.

Notes to Social Data Table

Physical Quality of Life Index (PQLI)

PQLI is a non-income measure that summarises many aspects of well-being. It is computed from the three well-known social indicators of infant mortality, average life expectancy at age one and literacy.

Number enrolled in primary school as % of age group

Primary school age is generally considered to be 6-11 years. In countries with universal primary education, enrolment ratios may exceed 100% because some pupils enrolled in primary schools may be below or above the official primary school age.

MRE: Columns headed MRE (1982-85) indicate that the figures given are for one year within that period.

Population growth

*Estimated annual rate of population growth within the period shown.

Footnotes

A = 1976 D = 1980
B = 1977 E = 1981
C = 1978 F = 1983
